

COMMANDER DECISION BRIEF

NAME: ALIA ISLAM

Github:

<https://github.com/liacodes49/Career-Forge/tree/day-6-the-pressure-window/day-06-pressure-window>

1. Top Priority

Protected customer-money trust by containing duplicate charges and preventing further financial harm before addressing secondary issues.

2. Second Priority

Stabilized communication with support and stakeholders to reduce confusion and preserve customer trust.

3. Intentional Deferral

Deferred inventory reconciliation and webhook optimization because they were not causing irreversible financial damage during the pressure window.

4. Accepted Risk

Accepted slower order confirmations while prioritizing prevention of duplicate payments, as delayed confirmation is less damaging than charging customers twice.

5. Stakeholder Communication

First communication: Support team, founder, and customers.

Message:

We are investigating checkout instability affecting payments. We have prioritized protecting customer transactions and are temporarily limiting risk while we verify payment integrity. Refund guidance and updates will follow as verified information becomes available.

6. Next 30-Minute Plan

1. Verify payment gateway integrity and stop duplicate charges.
2. Audit affected transactions and prepare refunds.
3. Restore checkout gradually while monitoring metrics.

7. One Decision I Would Change

I would have paused checkout slightly earlier instead of allowing limited traffic. It may have reduced customer impact and support load. I learned that early containment often costs less than prolonged uncertainty.

8. Final Command Rationale

My command strategy focused on protecting customer money and trust before revenue or cosmetic system issues. I contained the blast radius, communicated uncertainty quickly, accepted temporary business loss, and intentionally deferred lower-priority work. Every decision balanced customer impact, operational stability, and long-term trust rather than short-term revenue.
