

Release Judgment Decision

Student: Alia

Variant ID: D3-A

Final Decision

CONDITIONAL

Decision Evidence

Evidence	Supports	Why It Matters
ENABLE_RESUME_ANALYSIS=false in .env	Conditional	Core feature was off by default in production config
Empty AI_PROVIDER and AI_SERVICE_KEY	Conditional	Production guard in routes.js blocked all analysis calls
Empty tmp/resumes/ directory	Conditional	No resume data existed for any candidate
Full workflow passed after fixes	Conditional not Block	Workflow is viable once config is correctly set

Blockers

- Resume analysis disabled by default in production .env
- AI provider and key not configured
- Resume source files missing from deployment

Conditions If Proceeding

1. ENABLE_RESUME_ANALYSIS=true must be set in .env on demo machine
2. AI_PROVIDER=mock and AI_SERVICE_KEY=mock-key must be set
3. Resume .txt files must exist in tmp/resumes/ for all candidate IDs
4. Port conflict must be resolved (use PORT=5001 on macOS)

Final Release Defense

The founder declared the product ready based on health, login, and candidate list. None of those checks touch the core workflow. When the actual Analyze Resume workflow was run, it failed immediately with four separate blocking issues, all rooted in missing or incorrect production configuration. The app was not ready to demo in its committed state.

After minimal targeted fixes to the .env and resume files, the full recruiter workflow completed successfully end to end, including score display, status update, and dashboard refresh.

The decision is Conditional: the demo may proceed only on a machine where all four config conditions are verified before the recruiter touches the product.
